Note:

The test results of this test report relate exclusively to the item tested as specified in this report. The CETECOM ICT Services GmbH does not assume responsibility for any conclusions and generalizations drawn from the test results with regard to other specimens or samples of the type of the equipment represented by the test item.

The test report may only be reproduced or published in full. Reproduction or publication of extracts from the report requires the prior written approval of the CETECOM ICT Services GmbH.

During the test no hardware and software changes are allowed to be performed at the EUT.

1.3.3 Additional EUT information

The sample is a dual access point for dualband use. (2.4 and 5 GHz).

Inside the AP there are two identical RF parts, both are able to work on 2.4 and 5 GHz.

In this report we test the radiated emissions of the AP with external antenna Ant16 (Extender 0-30) at 2.4 GHz.

We tested spurious emissions and band edge compliance for each antenna type.

The maximal output power can be calculated by the conducted output power and the attached pattern of the antenna.

Other antennas and frequency ranges are tested in separate reports.

The complete test report for the AP at 2.4 GHz is 2-4556-01-02/07 from our house.

Antenna types: (gain according data sheet)

| Ant1: | BAT-ANT-8G | $2.4-2.5~\mathrm{GHz}$ | 8.0 dBi |
|---------------|------------------------|------------------------|----------|
| Ant3: | BAT-ANT-TNC_B_D-085-01 | 2.3 - 2.5 GHz | 8.5 dBi |
| Ant4: | BAT-ANT-TNC_B_D-085-02 | 2.3 - 2.5 GHz | 8.5 dBi |
| Ant5: | BAT-ANT-TNC-8b/g DS | 2.3 - 2.5 GHz | 8.5 dBi |
| Ant9: | Extender I-60AG | 2.4 - 2.5 GHz | 6.0 dBi |
| Ant10: | Extender I-180 | 2.4 - 2.4835 GHz | 4.0 dBi |
| Ant13: | Extender 0-D80g | 2.3 - 2.5 GHz | 8.5 dBi |
| Ant14: | Extender 0-360ag | 2.3 - 2.5 GHz | 6.0 dBi |
| Ant15: | BAT-ANT-N-6abg | 2.4 - 2.5 GHz | 6.0 dBi |
| Ant16: | Extender 0-30 | 2.4 - 2.4835 GHz | 14.0 dBi |
| Ant18: | BAT-ANT-N-14g | 2.4 - 2.7 GHz | 14.0 dBi |
| Ant19: | Extender 0-70 | 2.4 - 2.4835 GHz | 8.5 dBi |
| | | | |

To simplify reading the report we use inside the short name of the antennas, ANT1, ANT2 etc.

3 RF measurement testing

3.1 Description of test set-up

3.1.1 Radiated measurements

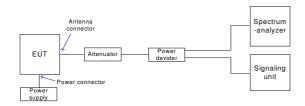

The radiated measurements are performed in vertical and horizontal plane in the frequency range from 9 kHz to 25 GHz in semi-anechoic chambers. The EUT is positioned on a non-conductive support with a height of 0.80 m above a conductive ground plane that covers the whole chamber. The receiving antennas are conform with specifications ANSI C63.2-1996 clause 15 and ANSI C63.4-2003 clause 4.1.5. These antennas can be moved over the height range between 1.0 m and 4.0 m in order to search for maximum field strength emitted from EUT. The measurement distances between EUT and receiving antennas are indicated in the test setups for the various frequency ranges. For each measurement, the EUT is rotated in all three axes until the maximum field strength is received. The wanted and unwanted emissions are received by spectrum analysers where the detector modes and resolution bandwidths over various frequency ranges are set according to requirement ANSI C63-4-2003 clause 4.2.

Antennas are conform with ANSI C63.2-1996 item 15.

150 kHz - 30 MHz: Quasi Peak measurement, 9kHz Bandwidth, passive loop antenna. 30 MHz - 200 MHz: Quasi Peak measurement, 120KHz Bandwidth, biconical antenna 200MHz - 1GHz: Quasi Peak measurement, 120KHz Bandwidth, log periodic antenna >1GHz: Average, RBW 1MHz, VBW 10 MHz, waveguide horn with lownoise preamp

3.1.2 Conducted measurements

The EUT's RF signal is coupled out by the antenna connector which is supplied by the manufacturer. The signal is connected to the spectrum analyzer. The specific losses for signal pathsis first checked within a calibration. The measurement readings on the spectrum analyzer is corrected by the specific test set-up loss. The attenuator, power divider, signaling unit and the spectrum analyzer are impedance matched on 50 Ohm.

3.1.3 AC-conducted measurements

We used the dedicated power supply delivered by the customer.

3.7 MPE calculation

MPE calculation

These equations are generally accurate in the far field of an antenna but will over predict power density in the near field, where they could be used for making a "worst case" prediction.

$S = PG/4\pi R^2$

where S = power density (in appropriate units, e.g. mW/cm²)

P = power input to the antenna (in appropriate units e.g. mW)

G = power gain of the antenna in the direction of interest relative to the isotropic radiator

R = distance to the center of radiation of the antenna (appropriate units e.g. cm)

Or

$S = EIRP/4\pi R^2$

where EIRP = equivalent isotropically radiated power

Calculation:

(Calculated for max. EIRP)

EIRP: 40.01 dBm = 10023 mW

Calculation of minimal distance in cm:

distance = $(10023/(4\pi*1 \text{mW}))^{1/2}$ = 28.24 cm

Minimal distance needed: 29 cm

Limit:

1mW/ cm² is the reference level for general public exposure according to the OET Bulletin 65, Edition 97-01 Table 1.

3.8 Datasheet antenna

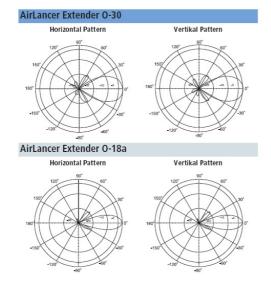

LANCOM AirLancer™ Extender outdoor antennas

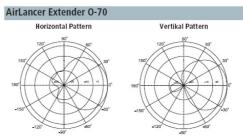

- ► Weather-proof antennas for outdoor use
- Directional antennas for wireless bridges and wide-angle antennas for campuses
- ► Complete sets include cables and mounting materials
- Optional extra lightning protection for outdoor AirLancer Extender antenna installations

AirLancer Extender outdoor antennas are the optimal WLAN add-on for interconnecting cabled LANs via wireless bridges or for establishing pico-cell networks on campuses, hotspots, or in large halls, for example. An optional extra recommended for outdoor use: The AirLancer Extender SA-5 lightning protection.
